

NUMBER THEORY, ALGEBRA, CALCULUS

Algebraic Theory of Numbers

Pierre Samuel

Translated from the French by Allan J. Silberger

Algebraic number theory introduces students not only to new algebraic notions but also to related concepts: groups, rings, fields, ideals, quotient rings, and quotient fields. This text covers the basics, from divisibility theory in principal ideal domains to the unit theorem, finiteness of the class number, and Hilbert ramification theory.

Vector Calculus

Peter R. Baxandall and Hans Liebeck

This introduction to the differential and integral calculus of functions of several variables offers a rigorous and comprehensive treatment. The classical theorems of vector calculus are amply illustrated with figures, worked examples, and physical applications. Numerous exercises, with hints and answers, range from routine calculations to theoretical problems.

Reprint of the Oxford University Press, New York, 1986 edition.

Introduction to the Theory of Numbers

Harold N. Shapiro

Starting with the fundamentals of number theory, this text advances to an intermediate level. The treatment is geared toward advanced undergraduates and graduate students and covers congruence, approaches to counting problems, and prime number theory. Harold N. Shapiro is Professor Emeritus of Mathematics, Courant Institute, New York University.

Lectures on Elementary Mathematics

Joseph Louis Lagrange

One of the 18th century's greatest mathematicians, Lagrange made significant contributions to all fields of analysis and number theory. He survived the French Revolution to deliver these lectures at the École Normale, a training school for teachers. An exemplar among elementary expositions, they feature both originality of thought and elegance of expression.

GEOMETRY AND RELATED TOPICS

Linear Geometry

Raphael Artzy

Most linear algebra texts neglect geometry in general and linear geometry in particular. This text for advanced undergraduates and graduate students stresses the strong relationship between algebra and linear geometry. Topics include transformations in the Euclidean plane, affine and Euclidean geometry, projective geometry and non-Euclidean geometries, and axiomatic plane geometry.

Cohomology Operations and Applications in Homotopy Theory

Robert E. Moshier and Martin C. Tangora

Cohomology operations are at the center of a major area of activity in algebraic topology. This treatment explores the single most important variety of operations, the Steenrod squares. It constructs these operations, proves their major properties, and provides numerous applications, including several different techniques of homotopy theory useful for computation.

GEOMETRY AND RELATED TOPICS

Introduction to the Geometry of Complex Numbers

Roland Deaux

Geared toward readers unfamiliar with complex numbers, this text explains how to solve the kinds of problems that frequently arise in the applied sciences, especially electrical studies. To assure an easy and complete understanding, topics are developed from the beginning, with emphasis on constructions related to algebraic operations.

Reprint of the F. Ungar Publishing Co., New York, 1956 edition.
