

The Descent of Man

Charles Darwin

Abridged and with an Introduction by Michael Ghiselin

Published on the anniversary of the great naturalist's 200th birthday, this collection of prime excerpts from Darwin's landmark work builds on the evolutionary concepts introduced in *On the Origin of the Species*. Praised by Sigmund Freud as "one of the ten most significant books" ever written, this volume theorizes man's descent from the apes, a revolutionary belief that became a turning point in history.

Basic Algebra

Nathan Jacobson

A pair of classic texts and standard references for a generation, these books are the work of an expert algebraist who taught at Yale for two decades. Rather than just a first course, Volume I covers all undergraduate topics, including groups, rings, modules, Galois theory, polynomials, linear algebra, and associative algebra. Volume II comprises all subjects of first-year graduate algebra. In addition to the immediate introduction and constant use of categories and functors, it revisits many topics from Volume I with greater depth and sophistication.
